Humantechnik:Alert Demo-function

The *Humantechnik:Alert* app can be tried out even without a given Gateway receiver.

The Gateway message server runs test channels, on which randomly generated alert signals are sent 24/7. These test alerts can be displayed on smartphones with an active internet connection.

Proceed as follows:

- Download the app from your respective app store, according to your phone's OS.
- Install the app according to the manual – see the link on the lower right side of the product web page.
- Enter one of the following numbers for code <u>and</u> ID on the settings screen of the app:

90 in Code and ID for the <u>Lisa</u> test channel

95 in Code and ID for the <u>Signolux</u> test channel

After testing and saving the connection, the smartphone will receive the various test alerts. An active internet connection is required!

To stop the app from receiving the test alerts, enter number **103** for Code and ID within the app settings. After testing and saving, there will be no further incoming alerts (test channel 103 is silent).

The reception of alerts can be activated and deactivated at any time by entering the given test channel codes above within the settings.

Please note:

This procedure **only simulates the function** of the app. The displayed alerts are <u>randomly generated</u> and are <u>not based on any existing alerting system</u>.

In order to transmit the alerts of an actual existing alerting system over the internet, it is necessary to purchase and install the Gateway device.
